1 `l3pdffield-radiobutton` Introduction

This is the documentation for radio buttons fields, for general information about form fields check the documentation `l3pdffield`.

Please keep in mind

- Not every PDF viewer supports radio buttons.
- The handling can depend on settings in the PDF viewer. In adobe reader for example I had to disable an option to avoid that it tries to create an appearance itself
- Standards like pdf/A disable features of form fields too (as you typically can't change the PDF).

2 Radio buttons

2.1 Commands

<code>\pdffield_radio:n</code>	<code>\pdffield_radio:n{<key val list>}</code>
--------------------------------	--

This creates a checkbox to check and uncheck. The list of allowed keys is described below. The *<key val list>* should at least set the name, without it the default name `checkbox` is used. Checkboxes with the same name belong to the same field and are checked and unchecked together. The default appearance is a quadratic frame with a `\texttimes` in it for the checked case. The default appearance is setup at the first use and will use the font family active at that time.
